

Web Work Works in Northern Saskatchewan

Mining in northern Alberta & Saskatchewan, is one of Canada's largest industries providing thousands of jobs and billions of dollars in commerce. Civil construction for this immense business is a massive undertaking and the Snake Lake Group of companies is one of the leading general contractors in the region.

Snake Lake Construction owns and operates millions of dollars in rolling equipment and as an industry leader, they realize the significant dollar value on each asset and the costs associated with downtime. That's why when Snake Lake Construction went looking for an Asset Maintenance system they chose to partner with a company whose 30 years of industry experience created a tremendous synergy.

Mr. Garnet Senger, Sr. Project Manager explains "Our staff love it (Web Work) for many reasons. New computer software can be overwhelming, but once they figured out how easy it was for them, they started to appreciate what it can do. We have now come to see what the benefits of the Web Work software is doing for us"

Using Web Work for proactive maintenance to eliminate downtime is a key focus for Snake Lake Construction. Scheduling maintenance activities around asset availability is paramount to ensure maximum operating efficiency. The maintenance coordinators rely on Web Work's advanced planning and scheduling component to effectively plan manpower and asset maintenance activities. All material and labour costs are tracked in detail for analyzing expense and asset value.

Snake Lake Construction chose to take advantage of the Web Work hosted solution to ensure they have guaranteed access to the Web Work system anywhere at any time. Future additions to the Web Work system for Snake Lake Construction will include an interface to a GPS asset location system.
